KNOWING UNIX

by The Kid & Co.

The UNIX operating system is popular among must amjor universities and companies such as AT&T. Learning how to back and use UNIX is important to any serious phone placeak or backer.

UNIX is a marvelous system which exists in many different forms: UNIX Release 7, UNIX 4.2BSD, UNIX System V. Currently, efforts are underway to make all systems conform to the UNIX System V interface standards. This will make the jobs of programming Unix systems and backing them much easier since everything will be "compatible." The techniques I am about to discuss should work under the two most popular versions—UNIX System V and UNIX 4.2BSD. The UNIX operating system has a reputation of not being very secure, yet many attempts have been made to make it that way. Many of them have been successful. Now let us embark on our quest for root (super user privileges).

In order to back a UNIX system, you must learn how to identify one. UNIX systems all have the same login and password prompts. These prompts appear to be unique to this system, therefore it is not even necessary to peneurate the system to identify it. The login prompts shown below are the standard prompts:

legin: Password:

i In order to start hacking, one must first get into a regularuser's account on the system. On some systems passwords are not even required, but they are suggested. Usually there are a few accounts on every machine with no password to theig. All that must be obtained to gain entry to these password-less accounts is the username. Finding a username is not an easy thing to do. The system could make the task of finding a username easier if it allowed "command togins." One system I know of allowed anyone to type the asername "who" at the login prompt and receive a list of all the users currently logged." into the system. If a backer were to encounter a system with this. feature (hole), his job would be made considerably easier. He could collect a list of usernames by using this "who" loginseveral times. Once one has a list of users, all one needs to do is, gooss the passwords which are typically easy even for the beginner. Here are some ascrnames along with some likely passwords. Notice the obvious patterns here. The specific usernames are not significant except in the case of root and field since these two accounts appear on every UNIX system.

Username . :	Password
ricoth (2.27)	superuse
Deld	hardwure
ght	gthgth
len û	km123
and the second second	

Comments
The Super User Account
Field Maintenance (has root privs)
Average user (notice the pattern)
Another average user

Successful login to a UNIX system would inok something like the following:

loginshacker Passasoni:

Last login: The May 20 23:30-32 on MyS2.

Welcome to hackvax Vax 11/780 4.2BSD

type "man xxxx" for information on xxxx...

The S is the command prompt. Once you have this, you are ready to start backing away. First we will learn how to use the telnet program to send mail to anyone on the system without having your backed account's username attached to it! You can even make the mail look like it came from anyone on the system or even from another system! Below we see a C program which allows you to do this in a nice neat way:

Pinchode (stdip.h) 'fuse 'greater than, less than' brackets on this line instead of parentheres!

main(arge_urgv)
char *argv[];
int arge;
(fuse an apon squiggly brocket heref
FILE *popen(), *fp;
char ch, to[81], fron(81], subject[81];

M(arge != 2)
(fuse an open squiggly brocket heee]
printf("To: "g"
gets(to);
) fuse a closed squiggly brocket heref

r price a closed squaggry bracket never else strepytise, argul I [); printf("Frome; "); gets(from); printf("Subject); "); gets(subject);

Fp=popers("telnet hubcop 25))/dev/mm(","w"); faise two 'greater than 'signs before the '/dev]

fprintf(fp, mail from: %s/n", from); [replace slashes with backslashes]

fpute(ch.fp): freplace slashes with backslashes/ pelose(fp);

fuse a closed squiggly bracket here!

This program should be placed into a file which ends in ,con the system and then compiled. One should use either ed or vi to create the file. It is not necessary to explain how to use these programs since that information can be obtained by typing either "man ed" or "man vi" at the command prompt. If we were to place this program into the file fakemaile then we would use the following command to comoile it:

ec -o fokemzil fukemzil r

To run the program, just type fakemail and it will run and prompt you. To terminate the message just type a control-D (the UNIX EOF mark). You can have a lot of fun confusing users by sending mail which appears to be from someone of importance like "root" or other important users.

All UNIX operating systems allow all users to look at the password file. Unfortunately the passwords are all encrypted. One can look at this file by typing "cat /etc/passwd" from the \$\mathbb{P}\$ prompt. Although you cannot get the actual passwords from this file you can get a list of every user on the system and a list of those users which do not have any passwords. If a user does not have a password, the encrypted password field will be not. The

A Trip To England

by John Drake

The following article comes to us from a writer who is spending some time in the Unland Kingdom. We welcome future countibutions from other writers in other countries. Please contact us if you have something to offer.

Phone Card Phones

British Telecom is trying to increase the number of these telephone booths throughout England since there is no money involved, and thus no reason to break into them. Phone cards are the same size as credit cards but they are green on black plastic base. The units of each card are divided up into two tracks of 100 units. Cards come in denominations of 10, 20, 50, 100, and 200 units. One unit is the same as 10 pence. To use the other track on the card (if there is one) you simply turn it around and insert the opposite long length of the card into the phone when the first track is all used up.

The phone "burns off" a unit at a timed interval which is determined by the number you dialed. You can make international calls from these phones. Free calls locally, long-distance, or international can be made from these phones by disconnecting (catting the wire or inserting a switch) the right wire that contains the incoming timing signals. The wires are color coded but BT (British Telecom) constantly changes this color coding. You can use a voltmeter to deduce which wire you have to cut. The problem arises that the wire is usually hidden and protected unless it's in a school or in a building as opposed to a phone booth. You can always disconnect it at its source which is iaside the phone. It stands to reason that since the phonecard phones contain no money that the locks will be lax or, easier yet, standardized for all phones. Once inside, you can disconnect the wire going into the write head.

There is such a phone at an international school in London. The wires of the phone are very bare and I believe that someone at the school has figured out which is the right wire to cut. The students have been making free international phone calls around the world for several months now. British Telecom has been around to fix the phone several times to no avail. Finally, two weeks ago, they cut all the wires and left the phone for dead. During the past week they have reconnected the phone and for the time being it is burning off the credits when you make a call.

The wires going into the phone are still bare...,

Modern Standards

Prestel's odd standard of 1200/75 has carried over to most other non-Prestel systems. This includes mainframes, Viewdata, and even some BBS's. 300/300 (not U.S. compatible) modems are becoming more popular as are 1200/1200 (U.S. compatible). Other speed configurations are 1200/75 Viewdata and 1200 Spectrum. There is a device which clips onto the modem port and that acts as a buffer for your 1200 band modem and makes it compatible with the 1200/75 computers here.

Phone Fraud in Governor's House

Phincipletis Incorpor

Though his aides insist it was neostly a case of "kids being kids." Governor Thomburgh's state telephone credit card was used for hundreds of personal calls, some of them made by

numbers of the governor's family,

The personal long distance calls—dating to the beginning of the Thornburgh administration—were included in bills submitted to the state. They were routinely processed and paid in full. It was only recently, when word of inquiries from a reporter filtered back to Thornburgh's press office, that a review was done on the phone bills.

. The review showed that about \$4,330 worth of personal long-distance phone calls had been made in a 6½ year period eating in October 1985. All of those calls had been made using the state telephone credit-card number assigned to the

gavernor.

A spokesman said that Thomburgh personally reimbursed the state for \$1,751.98 worth of calls made by members of his family. He said the state also had been reimbursed by a private citizen, whom he would not name. for an additional \$2,582.52 in personal long-distancee calls that had been made by "a teenager" using the governor's card number.

BB Watching VDT Operators

USA Today

8.6 million viden display terminal operators are being monitored by their computers, according to the National

Institute of Occupational Safety and Health.

Employers—such as insurance companies, airlines, supermarkets, post offices, and telephone companies—are using computers to record when an operator is off a VITI, count keystrokes by the second, time customer service transactions, and track errors. They say workers do more when they know they're being watched.

"Yes, in the short term you can squeeze more out of people." says Harley Shaiken, technology professor at the University of California in San Diego. "But in the long term, it destroys creativity and the initiative and desire to do a good job."

PSA Inc. of San Diego began in March to give demerits to reservation agents, who don't meet certain standards. PSA agents are allowed to leave their terminals a total of 72 minutes during an 8.5-hour shift. They can't spend more than 109 seconds percall and more than 11 seconds between calls. If they do, they collect demerits: 37 in a year could get them fired.

Workers are fighting back in unusual ways. Some are hanging up on customers to reclude average call times. Others take work, holding a finger on a key and filling computer screens with one tener.

. (Residers; we welcome any other suggestions for beating this horrible, nasty system. These people need our help!)

LD Companies Strike Back

The Wall Steep Journal

Victor and Berry Humphrey got a surprise package on their 38th wedding anniversary last month: a \$258,000 bill for long distance phone calls they didn't make.

GTE Sprint says the 5.600-page, 24-pound bill resulted from fraud. During a six-day dioling spree, it says, sometes at prisons across the country charged 46.000 calls to the Humphrey's code before the company cancelled and replaced the member.

But while the Humphrey's are off the hook. Sprint isn't. They must pay the costs of providing service, whether or not they themselves get paid. Investigators say that illegitimate use of billing codes issued to customers of companies other than AT&T was responsible for a significant portion of the estimated \$500 million that the long distance industry lost to tall fraud last year.

The companies are lighting back. Among other steps, they have fitted their switching equipment with anti-fraud software and forged a new industry coalition to bolster prosequition efforts. Some companies permit customers who are traveling to place calls only to numbers in their home area codes.

Many companies have joined the Communications Fraud Control Association, a trade group formed last year to combat toll fraud. The companies complain, however, that they don't always get the cooperation they expect from local law-

enforcement agencies.

In February, Teltee Saving Communications Co., a Miamibased long distance company, filed suit in state court against 38 people, including the operators of seven electronic bulketin boards, accusing them of either using fraudulently obtained codes or permitting them to be posted. Although the case hasn't yet gone to trial, some defendants have settled out of court, agreeing as part of the settlement to post the word on underground electronic networks that computer trime doesn't pay.

Talter has put its own message in hulletin boards where it found its codes posted, offering up to \$10,000 for information on who was posting the codes, it has also posted phony codes,

then traced people who used them.

Leave Our Poles Alone!

James Journal

In full view of local police, Republican congressional candidate Albin Sires recently carried out his planned "civil disobedience" by nailing a political poster to a utility pole.

"Those are our poles," said a spokesman for New Jersey Bell, "The posters are a safety hazard. We don't want them. We say

please leave our poles alone."

Phone Booths Mauled Then Stolen

Lengt Fland Syssidis

"Someone apparently used a chain attached to a truck, "said a New York Telephone spokesman when he referred to two phone booths that were stalen, Each of the missing hapths weighed 400 pounds. And each was secured by a six-inch bolt to a concrete slab outside Weir's Delicatessen in Mediford,

Town highway department workers reported the hooths missing at 4:30 am. Telephone company employees inspected the site and found only the bolts surrounded by pieces of broken glass as well as smashed panels and rubber molding.

According to Weir's clerk the theft was the (inal indignity suffered by the booths, "People would slum the phone down, break the receiver, take a harmer and ham," he said, "They'd get mad when they'd lose their money,"

The New York Telephone spokesman said that public phones get "hombed, bludgeoned and stuffed," But, he added, "It's unusual to see a booth hauled off,"

New York Telephone is offering a \$2,000 reward for information shout the them. The number to call is 8005225599. The numbers of the missing payphones were \$167328600 and \$167328550.

The Ghost in the Machine

Link

The 91f operators have learned that when they get a call and hear no voice on the line, a cordless phone is frequently at fault.

A rogue phone's dialing system is apparently triggered by line batteries, or by interference from boutehold gadgets such as microwave ovens, fluorescent lights, hair dryers, and garagedoor openers. Three-digit numbers are hit most often (411 for directory assistance also gets such calls).

For emergency operators, the problem is more than a missinge, Silent calls must be traced, in case a human rather than a pharatom needs kelp.

3-59

letters of the month

Dear 2600:

Congratulations on the apparent success of your newsletter. I leave something from each issue. Your points on the power of computers and the information that is processed on them are correct. And you provide a valuable service by attempting to educate your readers and (sometimes) chide those who would use the information improperly.

I work on the other side of the fence—data security for a large corporation. I don't always like what you say about the condition of my profession—because it is usually too painfully true!!! I also have the nature to try, test, and explore new areas to see what happens. But I wouldn't proceed to the point of "crashing" or "disabling" a system as was stated on page 3-42 of

your June issue, Finally, the point of my letter!

Please don't tell people how to crash a computer system. It may prove your technical superiority, or that you can read a technical manual. However, just as the lives of many innocent people connected with your BBS and others were unjustly and adversely affected by taids by uneducated and unqualified intruders, crashing a major (or minor) computer system has serious consequences to innocent people, directly or indirectly. And, unless you know the effect you have on my business (retail, oil, hanking, public utility, medical care, etc.), you are just as naive, over-your-head, and dangerous as the authorities that confiscate a BBS,

On a lighter note, we don't need your help anyway. We crash our systems on an irregular basis. Unintentionally, of course. Which helps explain why you see so few computer professionals laitering in pool halls these days. They are too busy trying to secover from the latest/greatest technology.

Keep up the good work.

The Stopper

Dear Stopper:

Please note that those people who confiscate BBS's get the full support of law, unlike those who crash main-frames.

On whether or not we will stop printing system shut-down procedures, that is something we shall consider. Our main point is to show how easily it can be done by anyone—a computer buff or a salvoteur.

Dear 2600:

I am a lawyer with an avid interest in BBS's or StG's that handle law-related material or are aimed at lawyers. Do you or your readers know of any such boards other than the StG's on CompuServe, the Source, and Bix? Are there any that have shut down? I would like to hear from anyone who has had any experience with these boards or lawyers who use them.

I am on CompuServe, BIX, and ABA/net (1825).

Reex Morrison 14 Montrose Road Scaradale, NY 10583

Dear Mr. Morrison:

Please send us the list of the law-related BBS's that you know of, and we ask our other readers to do the same. We can publish them in the near future.

Dear 2600:

As a veteran VAX/VMS wizard and a new subscriber to 2660, I was interested to see the front-page article (July 1986) on the subject of VMS security backing. I was disappointed; though, to find that "Violating a VAX" dealt with the subject at a junior-high level. I'm not necessarily criticizing the article or its author on that account; we all have to crawl before we learn to walk, and all that. However, I'd like to save would-be VMS backers some embarrassment by pointing out a few mistakes to avoid. If you do things Baatzebub's way, your friendly local system manager will soon be knocking at your door with a sheaf

of printouts in his hand and a stern look on his face.

The password-grabber command procedure presented in the article illustrates a number of blunders:

I. First, that "%DCL-F-TRANS" crap is completely bogus, in several senses of the word. Why bother taking a login and making up an error message when you can just simulate a user validation error and make it look as though the user has mistyped his password? Simulating a login error and killing the process is a lot safer than presenting the user (who may not be all that stupid, even if he is a system manager) with a series of obviously bogus "system" messages.

 You can use the DCL command "STOP/IDENT=0" to log out without generating a message. This doesn't require any privilege at all, in a program, you can use SYS\$DELPRC.

3. Using INQUIRE to read the username and password is foolish when you can use the READ command with the /PROMPT and /ERR qualifiers. Also, READ has a timeout option. By the way, the default timeout count at logic is 30 seconds, not 20 seconds as implied in the article.

4. The command procedure given doesn't use SET MESSAGE to get rid of any error messages which might possibly be generated if things go wrong—another potential source of user tip-offs that something fishly is going on.

Where VMS is enaccined, the whole password-grabber concept is practically obsolete anyway, since VMS V4 defines a terminal characteristic called "SECURESERVER" which was designed specifically to foil password-grabber programs. When a terminal line has this characteristic set, pressing the BREAK key at login is guaranteed to disconnect any process running on the terminal.

A few other notes: 1) Control-T isn't very useful at login time. Repeated control-Y's immediately following the password are more useful, but the "DISCTLY" flag in the UAF prevents them from having any effect. 2) Using "890" as a file version number is silly. (Suppose that version 891 or higher already exists.) The number you want is 32767; that's the maximum possible version number. RTFM: 3) The first "Trojan horse" procedure given should include the command "SET DEFAULT SYS\$LOGIN" before the DELETE command which is supposed to get rid of the incriminating LOGIN, COM file.

As operating systems go, VMS is very secure, and it's becoming more so with each new release, (Unfortunate but true.) According to DEC, a version of VMS will have the Defense Department's highest possible security rating within two or three years.

In parting, I offer you at 2600 a slogan for your musthead: "The read of access leads to the polace of wisdom." Apologies to William Blake.

Dear 2600:

I noticed a problem in the password grabber described on page 3-49 of your July 1986 issue. In the narrative, it says that control-Y is disabled, but the code doesn't actually disable control-Y; it merely provides direction on what to do if a control-Y is encountered. In this case, if a control-Y is entered during the wait period, then the program will just continue with the next step after the control-Y interrupt. Since there is no step after the WAIT, the program will exit in this case. To use the ON CONTROL-Y effectively in this case, you need to loop back so that any control-Y will reset the wait timer: \$1.00Pt, SON CONTROL-Y THEN GOTO LOOP, \$WAIT 01:00:00.

An even better solution would be to actually disable the control-Y early in the program with a SET NOCONTROL command. In fact, it would be useful to also disable control-Y

SYSTEMATICALLY SPEAKING

USSR Computer Hungry

Land Mand Moveder

The Soviet Union has announced sweeping reforms in its "obsolete" higher education system, which it said produces doctors who cannot diagnose and engineers who know little about computers.

"Materials and techniques are obsolete. That is why there is a need for the profound restructuring of higher and secondary specialized education," the Communist Party newspaper *Providu* said in announcing proposed changes that will affect 2 million students and set up thousands of computer-equipped workplaces to make Russians "computer literate".

ATM's in China!

Combined News Sources

NCR Corporation has installed the first automatic teller machine in China. The unit will be operated as a test case by the Nantung Bank in Zhuhai, an economic "free zone" near the Hong Kong border. The machine won't be available to citizens of the People's Republic.

Cash Machines Are Popular

New York New-day

Just a year after the New York Cash Exchange was formed, the system that lets customers of one bank use automatic tellers at competing banks has virtually run out of institutions to recruit.

The regional system now has 1.225 machines and 4.2 million customers, making it one of the largest in the nation. The 55 institutions set to join will boost NYCE to 2.000 machines and 6.5 million customers, with a total of 80 institutions in eight states, the District of Columbia, and Puerto Rico.

The system's chief New York rival is Citibank, which has its own network of 626 machines and 1.5 million card-holders. Citibank has shown little interest in joining NYCE.

NYCE may try out a new project—a debit-card system. If such a system were in place, a customer could buy clothing at a local department store using a bank card, and a sales clerk could deduct the purchase price right from the customer's checking account.

TV Blue Boxes

Radio Decircile

The coming generation of digital TV sets is designed for easy servicing by reprogramming them. Access for servicing, in the case of sets using ITT digital IC's, is provided via a rear-panel connector or by dialing up a special code on the wireless remote-control unit. In both cases, that gives the repair technician access to the set's control hus. From there, it would be an easy matter to defeat the sync-suppression decoding used by most cable-TV systems for their premium channels, according to engineers of the National Cable TV Association. The NCTA fears that the introduction of digital TV sets will lead to a fined of "blue boxes" to let cable subscribers decode pay-TV programs without paying for them. The NCTA has written to all major TV set manufacturers organ; them to "take the necessary steps to make it impossible to externally force" one of FTTs VLSI chips to defeat pay-TV encoding.

New Chip Helps Sprint

195 Take

About 30 percent of telephone customers won't get requal access service until 1987 or later. Those customers would ordinarily be lost to US Sprint, because to get on Sprint's system the customer would have to dial more than 20 digits. So Sprint came up with a microprocessor that automatically dials all the Sprint access numbers when a user dials "1." Sprint will install it free on the premises of any customer with bills of \$150 or more.

Government Phone Fate?

The San York Turk

The Federal government has started to update its entire system of lines, switching equipment, satellites and security devices, which has been in place since 1964. The current system is still managed by AT&T and cannot handle the demand of increased numbers of calls and high-speed data communications.

The General Services Administration has invited communications companies to come up with ideas for a new system. The Government's next phone company, like AT&T, will be privy to information about encoded data and will therefore be required to have a high-level security elegrance. The companies are being asked to devise advanced ways to protect communications from phone tapping, subotage, and even disruption caused by the electro-magnetic pulse that destroys conductors of electricity after a nuclear explosion.

The system. "FTS 2000", is expected to be in place by the year 1990 and will cost 4 billion of your tax dollars.

Rural Radio Phones

Communications Work

Four telephone associations and the Rural Electrification Administration (REA) have asked the FCC to set aside certain radio frequencies to be used for telephone service in rural areas.

Using radio instead of land-based wire could lower costs of connecting customers, permitting teleos to extend coverage in areas where costs have previously prevented it, according to the group's FCC filling.

They called the rudio service Basic Exchange Telecommunications Radio (BETR).

If the request is granted in full, BETR could extend service to an estimated 485,000 customers nationwide who are currently without telephones. Another 400,000 could have service upgraded from multi-party to one-party lines.

The groups want the FCC to allocate 26 channels in the 450 MHz band and two 800 MHz channels to BETR.

"Debugging" Phones

Basings Was

It may not be what the phone company had in mind when it came up with the memorable slogan "Reach out and touch someone," but a tiny company called Biol lygenix Ire. plans to publicize a list of unsavory bacteria and fungi that it says inhabit the month and carpicess of most telephones.

The Fremont (CA) startup, of course, is providing more than a public service. It has a product: a patented plastic telephone cover impregnated with vinyzene, an antimicrobial preparation developed by Morton Thiokol Inc.

format of /etc/ passwd entries follows:

wereencrypted productor $^{\mu}$ egroup $^{\mu}$ emise, infothome dimprogrexegated upon Ingin

Examples from an actual /ctc/passwd file (the first 4 accounts are present on virtually all UNIX systems);

root:QunylCL@hmthg:@:10:System Account:/z/b/m/esh-

daemone*:1:31:The devil himself:/:

unepraxve4:f:ONIX-to-UNIX Copy://use/spool/uneppublic://use/ lih/mmp/mucleo-

fielddyrH0hALU aCo.0:10:Fleid service aconunt;/usr/field:/bin/csh paul:VKFuS77wLi0gM:5:10:Paul G. Ester:/usr/users/paul:

lenny::10:20:Lenny Kern (dumb user w/no pusswd):/usr/ users/lemny:/bird/sla

Those entries in the password file which have a user number. of 0 are accounts which have super user privileges and should be primary targets for password hacking techniques.

This should be enough to get you going on UNIX backing. Look for part two which will contain more advanced methods

of backing.

while the Password Grabber is running; that would avoid the situation described in the second paragraph of the article. For example, if the victim has the presence of mind to enter a control-I while the password grabber is at the WAIT step, it will be obvious to the victim that he is still logged on. The solution is to outer SET NOCONTROL=(Y,T) early in the program.

Dear Renders:

Last month, you read about the "free phones of philly." Chester Holmes told you about free calls from various payphones that have equal access.

One of our writers was on a recent trip across the country, and he had an opportunity to test Mr. Italmes' discovery out in other cities around the nation.

In Chicogo and Los Angeles, for example, pay phone calls are free when one simply chooses an alternate carrier before dialog, 10444, 10777, and 10888 worked. A more complete list (furnished by Kid & Co.) can be found in this month's 2000 Information Bureau.

For you Telco executives—you should realize that Philadelphia, Chicago, and Los Angeles are among the largest cities in this country and represent a very large hole to patch (not to mention the test of the free world).
